

Deployment and Forwarder Management >

Deployment Server

- Allows you to manage groups of Splunk Enterprise instances from a central location
- Identifies clients and subscribes them to server classes

Deployment and Forwarder Management >

Deployment Server

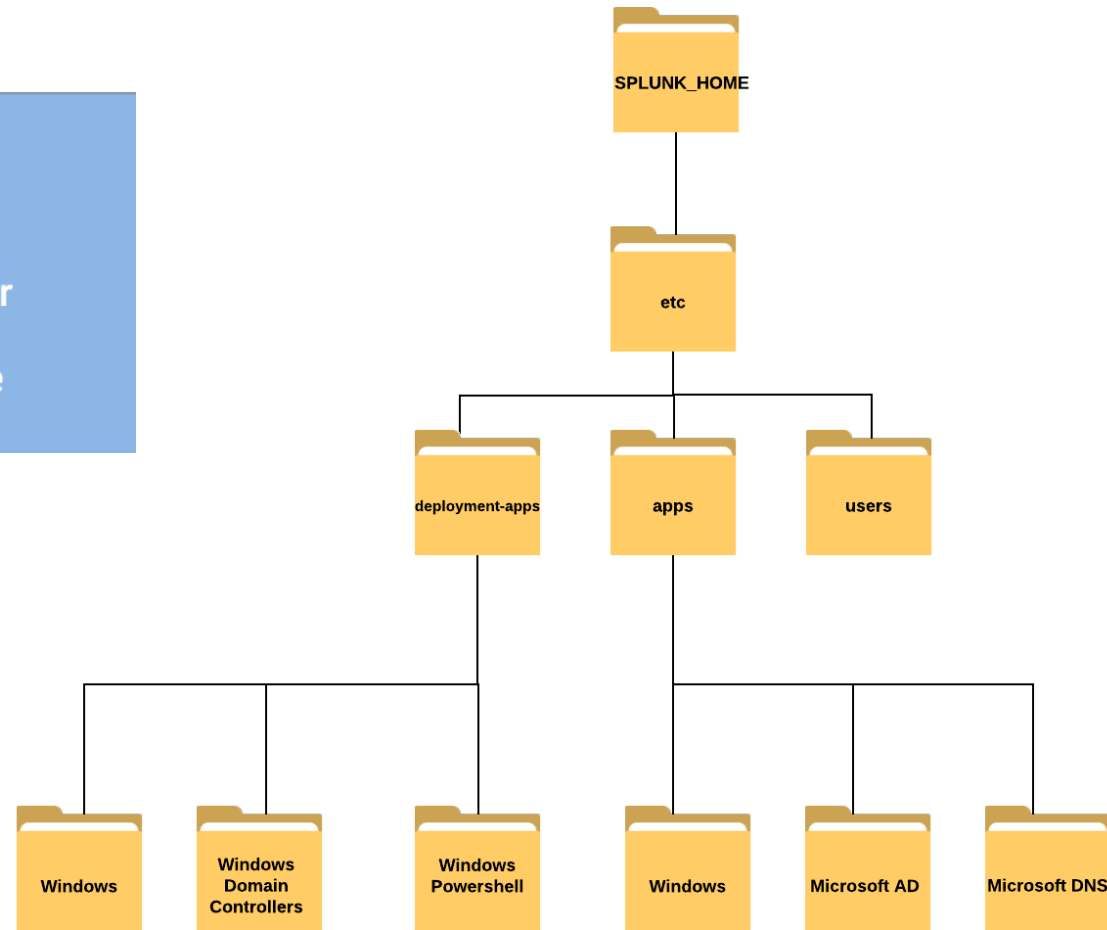

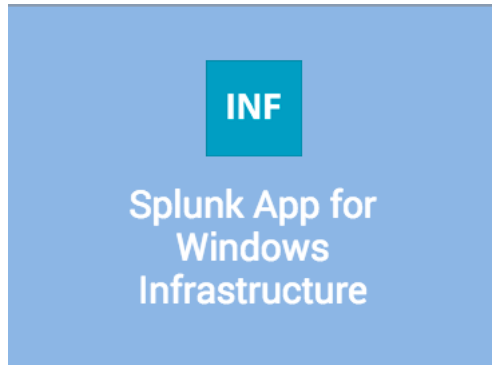

- A server class defines a group of Splunk deployment apps and adds them to its member criteria
- Each client of a server class reconciles its apps with the server
 - If it is missing any, it pulls them from the deployment server

Deployment and Forwarder Management >

Deployment Server

- Deployment apps are located in `/etc/deploymentapps`

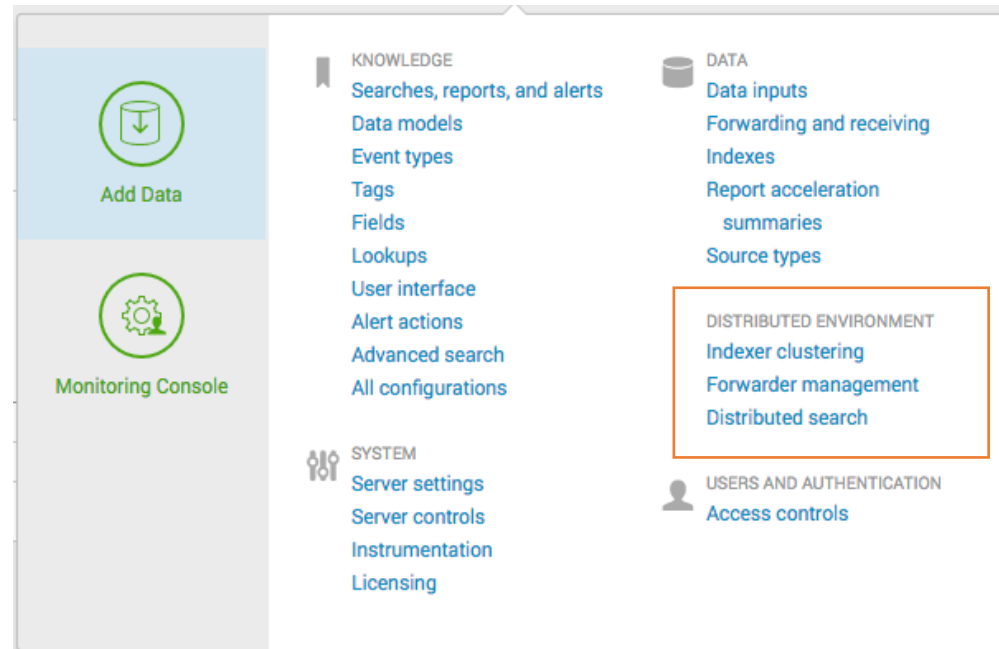

Deployment and Forwarder Management >

Deployment and Forwarder Management >

Deployment Server

- To manage deployment servers, go to Settings, Distributed Environment, Forwarder Management

Demo: Deployment

Thanks, Splunkers!
